Cognitive Systems - Information Processing Meets Brain Science presents an overview of the exciting, truly multidisciplinary research by neuroscientists and systems engineers in the emerging field of cognitive systems, providing a cross-disciplinary examination of this cutting-edge area of scientific research. This is a great example of where research in very different disciplines touches to create a new emerging area of research. The book illustrates some of the technical developments that could arise from our growing understanding of how living cognitive systems behave, and the ability to use that knowledge in the design of artificial systems. This unique book is of considerable interest to researchers and students in information science, neuroscience, psychology, engineering and adjacent fields. The Cognitive Psychology of Planning assesses recent advances in the scientific study of the cognitive processes involved in formulating, evaluating and selecting a sequence of thoughts and actions to achieve a goal. Approaches discussed range from those which look at planning in terms of problem-solving behaviour to those which look at how we control thoughts and actions within the frameworks of attention, working memory or executive function. Topics covered include: simple to complex tasks, well- and ill-defined problems and the effects of age and focal brain damage on planning. This survey of recent work in the cognitive psychology and cognitive neuropsychology of planning will be an invaluable resource for anyone studying or researching in the fields of thinking and reasoning, memory and attention. Peoplewatching is the culmination of a career of watching people - their behaviour and habits, their personalities and their quirks. Desmond Morris shows us how people, consciously and unconsciously, signal their attitudes, desires and innermost feelings with their bodies and actions, often more powerfully than with their words. The notion of social justice permeates much of current Western political and cultural discourse with a newfound urgency. What it means to be socially just is a question Morris et al investigate and interrogate, looking at psychology's contributions to the subject and considering the practicality of social justice in light of modern subjectivity. The book begins by examining the lack of equity and inclusivity in education and the ways in which psychology has been complicit in the marginalization of oppressed groups. Drawing upon Lacanian theory, it goes on to discuss how diversity initiatives take on an obsessive-neurotic characteristic that can stifle those it claims to understand and promote .The authors investigate the anxiety around the performance of being socially just or "woke" and suggest how psychology can contribute to the development of socially just humans, more attuned to the needs of others, through the appreciation of interconnectivity and compassion. An imperative text for scholars and students of philosophical and theoretical psychology, critical psychology, social psychology, psychoanalysis, social work and education. Mental Health Issues and the Media provides students and professionals in nursing and allied professions, in psychiatry, psychology and related disciplines, with a theoretically grounded introduction to the ways in which our attitudes are shaped by the media. A wide range of contemporary media help to create attitudes surrounding mental health and illness, and for all health professionals, the ways in which they do so are of immediate concern. Health professionals need to: be aware of media influences on their own perceptions and attitudes take account of both the negative and positive aspects of media intervention in mental health promotion and public education understand the way in which we all interact with media messages and how this affects both practitioners and service users. Covering the press, literature, film, television and the Internet, this comprehensive text includes practical advice and recommendations on how to combat negative images for service users, healthcare workers and media personnel. Psychologist Diana Baumrind's revolutionary prototype of parenting, called authoritative parenting, combines the best of various parenting styles. In contrast to previously advocated styles involving high responsiveness and low demandingness (i.e., permissive parenting) or low responsiveness and high demandingness (i.e., authoritarian parenting), authoritative parenting involves high levels of both responsiveness and demandingness. The result is an appropriate mix of warm nurturance and firm discipline. Decades of research have supported the prototype, and we now know that authoritative parenting fosters high achievement, emotional adjustment, self-reliance, and social confidence in children and adolescents. In this book, leading scholars update our thinking about authoritative parenting and address three unresolved issues: mechanisms of the style's effectiveness, variations of effectiveness across cultures, and untangling how parents influence children from how children influence them. By integrating perspectives from developmental and clinical psychology, the book will inform prevention and intervention efforts to help parents maximise their children's potential. The landscape of psychoanalysis has changed, at times dramatically, in the hundred or so years since Freud first began to think and write about it. Freudian theory and concepts have risen, fallen, evolved, mutated, and otherwise reworked themselves in the hands and minds of analysts the world over, leaving us with a theoretically pluralistic (yet threateningly multifarious) diffusion of psychoanalytic viewpoints. To help make sense of it all, Morris Eagle sets out to critically reevaluate fundamental psychoanalytic concepts of theory and practice in a topical manner. Beginning at the beginning, he reintroduces Freud's ideas in chapters on the mind, object relations, psychopathology, and treatment; he then approaches the same topics in terms of more contemporary psychoanalytic schools. In each chapter, however, there is an underlying emphasis on identification and integration of converging themes, which is reemphasized in the final chapter. Relevant empirical research findings are used throughout, thus basic concepts - such as repression - are reexamined in the light of more contemporary developments. This book aims to integrate different psychoanalytic schools and relevant research findings into an integrated psychoanalytic theory of the mind. A main claim explored here, is that a revised and expanded ego psychology constitutes the strongest foundation not only for a unified psychoanalytic theory, but also for the integration of relevant research findings from other disciplines. Sophisticated yet accessible, the book includes a description of the basic tenets of ego psychology and necessary correctives and revisions. It also discusses research and theory on interpersonal understanding, capacity for inhibition, defense, delay of gratification, autonomous ego aims and motives, affect regulation, the nature of psychopathology; and the implications of a revised and expanded ego psychology for approaches to treatment. The book will appeal to readers who are interested in psychoanalysis, the nature of the mind, the nature of psychopathology, and the implications of theoretical formulations and research findings for approaches to treatment. As such, it will also be of great value on graduate and training courses for psychoanalysis. Unexpected ways that individuals adapt technology to reclaim what matters to them, from working through conflict with smart lights to celebrating gender transition with selfies. We have been warned about the psychological perils of technology: distraction, difficulty empathizing, and loss of the ability (or desire) to carry on a conversation. But our devices and data are woven into our lives. We can't simply reject them. Instead, Margaret Morris argues, we need to adapt technology creatively to our needs and values. In Left to Our Own Devices, Morris offers examples of individuals applying technologies in unexpected ways—uses that go beyond those intended by developers and designers. Morris examines these kinds of personalized life hacks, chronicling the ways that people have adapted technology to strengthen social connection, enhance well-being, and affirm identity. Morris, a clinical psychologist and app creator, shows how people really use technology, drawing on interviews she has conducted as well as computer science and psychology research. She describes how a couple used smart lights to work through conflict; how a woman persuaded herself to eat healthier foods when her photographs of salads garnered “likes” on social media; how a trans woman celebrated her transition with selfies; and how, through augmented reality, a woman changed the way she saw her cancer and herself. These and the many other “off-label” adaptations described by Morris cast technology not just as a temptation that we struggle to resist but as a potential ally as we try to take care of ourselves and others. The stories Morris tells invite us to be more intentional and creative when left to our own devices. The great travel writer Jan Morris was born James Morris. James Morris distinguished himself in the British military, became a successful and physically daring reporter, climbed mountains, crossed deserts, and established a reputation as a historian of the British empire. He was happily married, with several children. To all appearances, he was not only a man, but a man’s man. Except that appearances, as James Morris had known from early childhood, can be deeply misleading. James Morris had known all his conscious life that at heart he was a woman. Conundrum, one of the earliest books to discuss transsexuality with honesty and without prurience, tells the story of James Morris—s hidden life and how he decided to bring it into the open, as he resolved first on a hormone treatment and, second, on risky experimental surgery that would turn him into the woman that he truly was. A reprint of the 1976 Macmillan edition. This fictional outline of a modern utopia has been a center of controversy ever since its publication in 1948. Set in the United States, it pictures a society in which human problems are solved by a scientific technology of human conduct. Although attachment theory was originally rooted in psychoanalysis, the two areas have since developed quite independently. This incisive book explores ways in which attachment theory and psychoanalysis have each contributed to understanding key aspects of psychological functioning--including infantile and adult sexuality, aggression, psychopathology, and psychotherapeutic change--and what the two fields can learn from each other. Morris Eagle critically evaluates how psychoanalytic thinking can aid in expanding core attachment concepts, such as the internal working model, and how knowledge about attachment can inform clinical practice and enrich psychoanalytic theory building. Three chapters on attachment theory and research are written in collaboration with Everett Waters. Just as Ginny begins to think that her divorced parents might like one another again, she learns that her father has a girlfriend, and the mixture of feelings this stirs up causes trouble at home and school--nearly ruining Halloween. Goal-Directed Decision Making: Computations and Neural Circuits examines the role of goal-directed choice. It begins with an examination of the computations performed by associated circuits, but then moves on to in-depth examinations on how goal-directed learning interacts with other forms of choice and response selection. This is the only book that embraces the multidisciplinary nature of this area of decision-making, integrating our knowledge of goal-directed decision-making from basic, computational, clinical, and ethology research into a single resource that is invaluable for neuroscientists, psychologists and computer scientists alike. The book presents discussions on the broader field of decision-making and how it has expanded to incorporate ideas related to flexible behaviors, such as cognitive control, economic choice, and Bayesian inference, as well as the influences that motivation, context and cues have on behavior and decision-making. Details the neural circuits functionally involved in goal-directed decision-making and the computations these circuits perform Discusses changes in goal-directed decision-making spurred by development and disorders, and within real-world applications, including social contexts and addiction Synthesizes neuroscience, psychology and computer science research to offer a unique perspective on the central and emerging issues in goal-directed decision-making Compliance with federal equal employment opportunity regulations, including civil rights laws and affirmative action requirements, requires collection and analysis of data on disparities in employment outcomes, often referred to as adverse impact. While most human resources (HR) practitioners are familiar with basic adverse impact analysis, the courts and regulatory agencies are increasingly relying on more sophisticated methods to assess disparities. Employment data are often complicated, and can include a broad array of employment actions (e.g., selection, pay, promotion, termination), as well as data that span multiple protected groups, settings, and points in time. In the era of "big data," the HR analyst often has access to larger and more complex data sets relevant to employment disparities. Consequently, an informed HR practitioner needs a richer understanding of the issues and methods for conducting disparity analyses. This book brings together the diverse literature on disparity analysis, spanning work from statistics, industrial/organizational psychology, human resource management, labor economics, and law, to provide a comprehensive and integrated summary of current best practices in the field. Throughout, the description of methods is grounded in the legal context and current trends in employment litigation and the practices of federal regulatory agencies. The book provides guidance on all phases of disparity analysis, including: How to structure diverse and complex employment data for disparity analysis How to conduct both basic and advanced statistical analyses on employment outcomes related to employee selection, promotion, compensation, termination, and other employment outcomes How to interpret results in terms of both practical and statistical significance Common practical challenges and pitfalls in disparity analysis and strategies to deal with these issues Never HIGHLIGHT a Book Again! This classic book allows its readers for the first time to comprehend the size, organization, staffing and operation of a national system of hospitals and residential services for the subnormal. It also allows for the first time, reliable estimates to be given of the scale and severity of certain problems. The basis has been laid for an evaluation of the effectiveness of hospitals for the subnormal. All this has been made possible by a generous grant from the National Society for Mentally Handicapped Children to the Department of Sociology in the University of Essex upon the foundation of the University. Of course, a great deal of further research remains to be done but a preliminary network of information is now available to all those deeply concerned about the handicapped. This is a study of the range and quality of institutional provisions made in England and Wales for that group of handicapped individuals who are known as mentally deficient. Dr. Morris reports on an investigation, which covered nearly half the hospitals for the sub-normal in the country: many of its findings can only shock and dismay. The investigation was concerned to discover what facilities-physical, occupational and educational-there was for patients, and to learn more about their social environment. It was also concerned to determine the extent to which both staff and patients are affected by their social environment, and by administrative action, and to learn something of the relationship between the hospital as an institution and the outside community, as well as between the patients and the outside world. In addition, it examined the extent to which the provisions and facilities available met the needs of the patients in relation to their physical and mental handicaps.
