Considered by many to be Abraham Robinson's magnum opus, this book offers an explanation of

the development and applications of non-standard analysis by the mathematician who founded the subject. Non-standard analysis grew out of Robinson's attempt to resolve the contradictions posed by infinitesimals within calculus. He introduced this new subject in a seminar at Princeton in 1960, and it remains as controversial today as it was then. This paperback reprint of the 1974 revised edition is indispensable reading for anyone interested in non-standard analysis. It treats in rich detail many areas of application, including topology, functions of a real variable, functions of a complex variable, and normed linear spaces, together with problems of boundary layer flow of viscous fluids and rederivations of Saint-Venant's hypothesis concerning the distribution of stresses in an elastic body. This introduction to the world of statistics covers exploratory data analysis, methods for collecting data, formal statistical inference, and techniques of regression and analysis of variance. 1983

edition. Standard Methods for the analysis of Oils, Fats and Derivatives Sixth Edition, Part 1 (Sections I and II) describes the methods of analysis, which have been adopted and edited by the Commission on Oils, Fats and Derivatives. This book is composed of two sections. The first section deals with the presentation of standard methods and procedure for oleaginous seeds and fruits analysis of oil, fats, and their derivatives. The next section describes the determination procedure of physico-chemical properties of determined oil, fats, and derivatives. Such characteristics include density, refractive index, color, dilatation, acid, ester, iodine value, and moisture and volatile matter content This book will prove useful to analytical chemists and researchers in the allied fields. Food safety is an important global public health and trade matter, with chemical hazards occupying centre stage due to associated acute and chronic health outcomes. There is also an increasing need to address antimicrobial resistance concerns. While

food remains a major vehicle for exposure to these hazards, related matrices cannot be ignored. Animal feed for instance may contain drug or pesticide residues as well as mycotoxins that could carry-over to food either as parent compounds or their metabolites of toxicological relevance. Contaminated water is also another medium of potential exposure to food hazards. A concerted effort is required to address the need for a safe food supply and one critical stakeholder is the testing laboratory. While this requires trained and capable analysts as well as reliable instrumentation, analytical methods are a major need. Development and validation - to ensure fitness of purpose - and availability of these methods is a necessity. This manual, consisting of several Standard Operating Procedures (SOPs), presents another opportunity for laboratories to address gaps in analytical methods and/or expand their options. The manual contains techniques for analyzing certain mycotoxins such as aflatoxins, fumonisin

and ochratoxin in matrices that include milk, edible vegetable oil and animal feed etc. A range of veterinary drug residues including permitted and prohibited substances in animal matrices including fish, are also addressed. Several pesticide residues in cereals, fruits and vegetables are also covered. A couple of methods for analysis of selected metals are also presented. 'This book is a superb textbook treatment of benefit-cost analysis. It is well designed for students in public policy, public administration, public health, social work, environmental affairs, law and business.' - John D. Graham, Indiana University, US 'Principles and Standards for Benefit-Cost Analysis is well worth reading. The volume reproduces some chapters previously published online in the Journal of Benefit-Cost Analysis alongside new material that has not yet appeared in print, and does so in a logical and appealing way. Even the several chapters with which I disagreed made me think hard about my own views. And thinking

hard is a good thing!' - Paul R. Portney, University of Arizona, US Benefit-cost analysis informs which policies or programs most benefit society when implemented by governments and institutions around the world. This volume brings together leading researchers and practitioners to recommend strategies and standards to improve the consistency and credibility of such analyses, assisting analysts of all types in achieving a greater uniformity of practice. Although new analytical approaches are constantly being used and tested, this book supports the emergence of a professional culture adhering to a set of principles and standards that can be used to identify useful analytical processes and to discard less useful ones. Contributors to this volume come from a wide variety of backgrounds and include authors of leading textbooks, editors of journals, former government officials, and practitioners whose analyses have shaped decisions about education, the environment, security, income distribution,

and other vital social and economic policies. Students and professors of public sector economics will find much of interest in this groundbreaking book. Practitioners working in government, non-profit organizations, and international institutions, including welfare economists, policy analysts, environmentalists, engineers, and others will also benefit from this volume's sophisticated and practical recommendations.
